(54) MRI APPARATUS TABLE POSITIONING METHOD AND MRI APPARATUS

(57)Abstract:

PROBLEM TO BE SOLVED: To ensure table positioning for aligning the part of interest of a subject with a magnet center.

SOLUTION: Three-plane real-time scans are performed whereby an axial image Sa, a sagittal image Ss, and a coronal image Sc are obtained in real time, and each image is displayed as a table positioning image. An operator views each image and controls the movement of a table so that the position of a part of interest three-dimensionally coincides with a magnet center. In this case, a scan parameter and the transfer characteristic of an RF/NMR signal can be varied as necessary. Thus, the table is moved as the operator views the actual position of the part of interest in the real-time images on three orthogonal planes, ensuring that the position of the part of interest three- dimensionally coincides with the magnet center.

LEGAL STATUS

[Date of request for examination] 16.03.2000

[Date of sending the examiner's decision of rejection]

[Kind of final disposal of application other than the examiner's decision of rejection or application converted registration]

[Date of final disposal for application]

[Patent number]

[Date of registration]

[Number of appeal against examiner's decision of rejection]

[Date of requesting appeal against examiner's decision of rejection]
